Efficient And Adaptive Estimation For Semiparametric Models

Eventually, you will unconditionally discover a extra experience and capability by spending more cash. yet when? reach you endure that you require to get those every needs taking into consideration having significantly cash? Why don't you try to acquire something basic in the beginning? That's something that will guide you to understand even more approximately the globe, experience, some places, next history, amusement, and a lot more?

It is your definitely own mature to acquit yourself reviewing habit. in the course of guides you could enjoy now is efficient and adaptive estimation for semiparametric models below.

estimation of the regression parameter in the adopted linear model. In this paper, we propose a class of ‘ Efficient and Adaptive Semi-Supervised Estimators ’ (EASE) to improve estimation efficiency. The EASE are two-step estimators adaptive to model mis-specification, leading to improved (optimal in some cases) efficiency under model

Finite-sample efficient estimators are extremely rare. In fact, it was proved that efficient estimation is possible only in an exponential family, and only for the natural parameters of that family. [citation needed] This notion of efficiency is sometimes restricted to the class of unbiased estimators. (Often it isn't.) Since there are no good ...

In this paper, we propose a class of “ Efficient and Adaptive Semi-Supervised Estimators ” (EASE) to improve estimation efficiency. The EASE are two-step estimators adaptive to model mis-specification, leading to improved (optimal in some cases) efficiency under model mis-specification, and equal (optimal) efficiency under a linear model.

This paper is concerned with estimating a conditional quantile function that is assumed to be partially linear. The paper develops a simple estimator of the parametric component of the conditional quantile. The semiparametric efficiency bound for the parametric component is derived, and two types of efficient estimators are considered.

Adaptive learning and efficient coding are part of these mathematical theories. E-I balance might a priori look like a phenomena observed in cortical circuits, due to biological constraints at the implementation level (i.e., keep neural activity in check, avoid synchronization, etc.), but without being a computational principle at the ...

Summary. Searching for an effective dimension reduction space is an important problem in regression, especially for high dimensional data. We propose an adaptive approach based on semiparametric models, which we call the (conditional) minimum average variance estimation (MAVE) method, within quite a general setting.

The proposed effort will further refine the adaptive model-based estimation and control guidance law developed during the Phase 1 effort to work in a two-tier algorithm with an agile, game-theoretic guidance law that is immune to the acceleration of the target.
